Configuration	Architecture	Cell-type-specific?	Tests
Pretrained Borzoi		No — one shared model, no PSI training at all	What splicing-relevant information already exists with zero PSI-directed training
Frozen-trunk head-only		Yes — separate head per cell type	What PSI-relevant information is already decodable from pretrained representations via a lightweight, per-cell-type head alone
Single-cell-type LoCon-adapted		Yes — fully independent model per cell type	Whether lightweight, per-cell-type trunk adaptation improves performance or shifts representation geometry vs. the frozen-trunk baseline
Shared-trunk multitask LoCon		Partially — heads are per-cell-type, trunk adaptation is shared	Whether a jointly-adapted shared trunk preserves cell-type-specific PSI differences or compresses them toward a shared profile
